

WINTER FIRE SAFETY TIPS FOR THE HOME

The high cost of home heating fuels and utilities have caused many Americans to search for alternate sources of home heating. The use of wood burning stoves is growing and space heaters are selling rapidly, or coming out of storage. Fireplaces are burning wood and man- made logs.

All these methods of heating may be acceptable. They are however, a major contributing factor in residential fires. Many of these fires can be prevented. The following fire safety tips can help you maintain a fire safe home this winter.

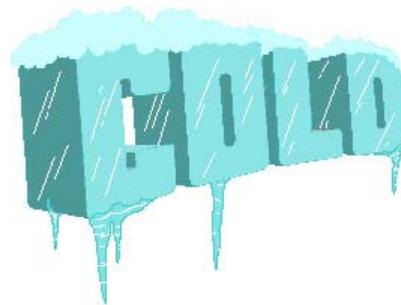

More than 4,000 Americans die each year in fires and more than 25,000 are injured. Many of them might be alive today if they had only had the information they needed to avoid a disaster.

Did You Know?...

Eighty percent of all fire deaths occur in the home.

Electrical fires are a special concern during the winter months which call for more indoor activities and increases in lighting, heating, and appliance safety.

Deaths caused by winter fires are particularly avoidable.

KEROSENE HEATERS

- Be sure your heater is in good working condition. Inspect exhaust parts for carbon buildup. Be sure the heater has an emergency shut off in case the heater is tipped over.
- Never use fuel-burning appliances without proper room venting. Burning fuel (coal or kerosene or propane, for example) can produce deadly fumes.
- Use only the fuel recommended by the heater manufacturer. *Never introduce a fuel into a unit not designed for that type fuel.*
- Keep kerosene, or other flammable liquids stored in approved metal containers, in well-ventilated storage areas, outside of the house.
- *Never* fill the heater while it is operating or hot. When refueling an oil or kerosene unit, avoid overfilling. *Do not* use cold fuel for it may expand in the tank as it warms up.
- Refueling should be done outside of the home (or outdoors).
- Keep young children away from space heaters—Especially when they are wearing nightgowns or other loose clothing that can be easily ignited.
- When using a fuel-burning appliance in the bedroom, be sure there is proper ventilation to prevent a buildup of carbon monoxide.

WOOD STOVES AND FIREPLACES

Wood stoves and fireplaces are becoming a very common heat source in homes. Careful attention to safety can minimize their fire hazard.

To use woodstove and fireplaces safely:

- Be sure the fireplace or stove is installed properly. Woodstoves should have adequate clearance (36") from combustible surfaces, and proper floor support and protection.
 - Woodstoves should be of good quality, solid construction and design, and should be UL listed.
- Have the chimney inspected annually and cleaned if necessary, especially if it has not been used for some time.
 - Do not use flammable liquids to start or accelerate any fire.
 - The stove should be burned hot twice a day for 15-30 minutes to reduce the amount of creosote buildup.

- Don't use excessive amounts of paper to build roaring fires in fireplaces. It is possible to ignite creosote in the chimney by overbuilding the fire.
- Keep a glass or metal screen in front of the fireplace opening, to prevent embers or sparks from jumping out, unwanted material from going in, and help prevent the possibility of burns to occupants.
- Never burn charcoal indoors. Burning charcoal can give off lethal amounts of carbon monoxide.
- Keep flammable materials away from your fireplace mantel. A spark from the fireplace could easily ignite these materials.
- Before you go to sleep, be sure your fireplace fire is out. *Never* close your damper with hot ashes in the fireplace. A closed damper will help the fire to heat up again and will force toxic carbon monoxide into the house.
- If synthetic logs are used, follow the directions on the package. *Never* break a synthetic log apart to quicken the fire or use more than one log at a time. They often burn unevenly, releasing higher levels of carbon monoxide.

FURNACE HEATING

- Be sure all furnace controls and emergency shutoffs are in a proper working condition.
- Leave furnace repairs to qualified specialists. Do not attempt repairs yourself unless you are qualified.
- Inspect the walls and ceiling near the furnace and along the chimney line. If the wall is hot or discolored, additional pipe insulation or clearance may be required.
- Check the flue pipe and pipe seams. Are they well supported, free of holes, and cracks? Soot along or around seams may be an indicator of a leak.
- Is the chimney solid, with cracks or loose bricks? All unused flue openings should be sealed with solid masonry.
- Keep trash and other combustibles away from the heating system.

OTHER FIRE SAFETY TIPS

- Never discard hot ashes inside or near the home. Place them in a metal container outside and well away from the house.
- Never use a range or an oven as a supplemental heating device. Not only is it a safety hazard, it can be a source of potentially toxic fumes.
- If you use an electric heater, be sure not to overload the circuit. Only use extension cords that have the necessary rating to carry the amp load. TIP: Choose an extension cord the same size or larger than the appliance electrical cord.
- Avoid using electrical space heaters in bathrooms, or other areas where they may come in contact with water.
- Frozen water pipes? Never try to thaw them with a blowtorch or other open flame, (otherwise the pipe could conduct the heat and ignite the wall structure inside the wall space). Use hot water or a UL labeled device such as a hand held dryer for thawing.
- If there is a fire hydrant near your home you can assist the fire department by keeping the hydrant clear of snow so in the event it is needed, it can be located.

FINALLY...

- Be sure every level of your home has a working smoke alarm, and be sure to check and clean it on a monthly basis.
- Plan and practice a home escape plan with your family.
- Contact your local fire department for advice if you have a question on home fire safety.
